~~A Primer for Ordinary Differential Equations~~

An ordinary differential equation (ODE) is an equation containing an unknown function of one real or complex variable x , its derivatives, and some given functions of x . The unknown function is generally represented by a variable (often denoted y), which, therefore, depends on x . Thus x is often called the independent variable of the equation. The term "ordinary" is used in contrast with the term ...

The costate equation is related to the state equation used in optimal control. It is also referred to as auxiliary, adjoint, influence, or multiplier equation. It is stated as a vector of first order differential equations $\dot{\lambda} = -\lambda^T \frac{\partial H}{\partial x}$ where the right-hand side is the vector of partial derivatives of the negative of the Hamiltonian with respect to the state variables.
