The inductance coefficients of a part of a circuit, and their applications Abstract: Problems in connection with cables and their sheaths can in some cases be usefully discussed by means of certain coefficients which are called in this paper partial inductance coefficients, so as to distinguish them from the ordinary self and mutual-inductance coefficients, the formulæ for which apply to complete circuits only.

Clearly I'm wrong, as if you consider the inductance of a 1m loop of 1mm wire my formula gives an inductance of 0.1uH and the real formula gives 1.02uH, which is quite a difference. This gross misunderstanding may or may not be relevant to my question. The actual question. I frequently see talk of partial inductance and this confuses me.

Partial inductance is derived from usual inductance by integrating the B field over a surface (giving flux), treating B as the curl of the vector potential A, with the flux integral now becoming a path integral of A on the path bounding the surface (the loop) by Stokes' Theorem.
